

Novel approaches in cancer pharmacology

Kareem Naser

Children's Cancer Hospital Foundation, Egypt.

Abstract

Compare and contrast targeted anticancer therapies to traditional chemotherapy agents. Given the generic name of a targeted agent, identify the type of agent and, if applicable, the information you can derive from the name. Explain how the mechanism of action of a targeted agent relates to tumor pathogenesis and the treatment of cancer. List the adverse effects associated with different targeted agents and relate these to each agent's mechanism of action. Recall the route of administration, important safety warnings, and patient monitoring parameters of the targeted agents. Identify the classes of targeted agents that are most likely to have drug-drug interactions.
